1.1 Subpackages

1.1.1 kenchi.datasets package

1.1.1.1 Submodules

kenchi.datasets.base module

`kenchi.datasets.base.load_wdbc` (*contamination=0.0272, random_state=None, shuffle=True*)

Load and return the breast cancer wisconsin dataset.

contamination [float, default 0.0272] Proportion of outliers in the data set.

random_state [int, RandomState instance, default None] Seed of the pseudo random number generator.

shuffle [bool, default True] If True, shuffle samples.

Returns

- **X** (*ndarray of shape (n_samples, n_features)*) – Data.
- **y** (*ndarray of shape (n_samples,)*) – Return -1 (malignant) for outliers and +1 (benign) for inliers.

References

`kenchi.datasets.base.load_pendigits` (*contamination=0.002, random_state=None, shuffle=True*)

Load and return the pendigits dataset.

contamination [float, default 0.002] Proportion of outliers in the data set.

random_state [int, RandomState instance, default None] Seed of the pseudo random number generator.

shuffle [bool, default True] If True, shuffle samples.

Returns

- **X** (*ndarray of shape (n_samples, n_features)*) – Data.
- **y** (*ndarray of shape (n_samples,)*) – Return -1 (digit 4) for outliers and +1 (otherwise) for inliers.

References

kenchi.datasets.sample_generator module

```
kenchi.datasets.sample_generator.make_blobs(centers=5, center_box=(-10.0, 10.0),  
                                             cluster_std=1.0, contamination=0.02,  
                                             n_features=25, n_samples=500, ran-  
                                             dom_state=None, shuffle=True)
```

Generate isotropic Gaussian blobs with outliers.

Parameters

- **centers** (*int or array-like of shape (n_centers, n_features), default 5*) – Number of centers to generate, or the fixed center locations.
- **center_box** (*pair of floats (min, max), default (-10.0, 10.0)*) – Bounding box for each cluster center when centers are generated at random.
- **cluster_std** (*float or array-like of shape (n_centers,), default 1.0*) – Standard deviation of the clusters.
- **contamination** (*float, default 0.02*) – Proportion of outliers in the data set.
- **n_features** (*int, default 25*) – Number of features for each sample.
- **n_samples** (*int, default 500*) – Number of samples.
- **random_state** (*int, RandomState instance, default None*) – Seed of the pseudo random number generator.
- **shuffle** (*bool, default True*) – If True, shuffle samples.

Returns

- **X** (*ndarray of shape (n_samples, n_features)*) – Generated data.
- **y** (*ndarray of shape (n_samples,)*) – Return -1 for outliers and +1 for inliers.

1.1.1.2 Module contents

1.1.2 kenchi.outlier_detection package

1.1.2.1 Submodules

kenchi.outlier_detection.angle_based module

```
class kenchi.outlier_detection.angle_based.FastABOD(algorithm='auto', contamination=0.1, leaf_size=30, metric='minkowski', novelty=False, n_jobs=1, n_neighbors=20, p=2, metric_params=None)
```

Bases: *kenchi.outlier_detection.base.BaseOutlierDetector*

Fast Angle-Based Outlier Detector (FastABOD).

Parameters

- **algorithm** (*str*, default *'auto'*) – Tree algorithm to use. Valid algorithms are ['kd_tree', 'ball_tree', 'auto'].
- **contamination** (*float*, default *0.1*) – Proportion of outliers in the data set. Used to define the threshold.
- **leaf_size** (*int*, default *30*) – Leaf size of the underlying tree.
- **metric** (*str or callable*, default *'minkowski'*) – Distance metric to use.
- **novelty** (*bool*, default *False*) – If True, you can use predict, decision_function and anomaly_score on new unseen data and not on the training data.
- **n_jobs** (*int*, default *1*) – Number of jobs to run in parallel. If -1, then the number of jobs is set to the number of CPU cores.
- **n_neighbors** (*int*, default *20*) – Number of neighbors.
- **p** (*int*, default *2*) – Power parameter for the Minkowski metric.
- **metric_params** (*dict*, default *None*) – Additional parameters passed to the requested metric.

anomaly_score_
array-like of shape (n_samples,) – Anomaly score for each training data.

threshold_
float – Threshold.

n_neighbors_
int – Actual number of neighbors used for *kneighbors* queries.

x_
array-like of shape (n_samples, n_features) – Training data.

References

x_

kenchi.outlier_detection.base module

`kenchi.outlier_detection.base.is_outlier_detector(estimator)`

Return True if the given estimator is (probably) an outlier detector.

Parameters `estimator` (*object*) – Estimator object to test.

Returns `out` – True if estimator is an outlier detector and False otherwise.

Return type `bool`

class `kenchi.outlier_detection.base.BaseOutlierDetector(contamination=0.1)`

Bases: `sklearn.base.BaseEstimator`, `abc.ABC`

Base class for all outlier detectors in kenchi.

References

anomaly_score (*X=None, normalize=False*)

Compute the anomaly score for each sample.

Parameters

- **X** (*array-like of shape (n_samples, n_features), default None*) – Data. If None, compute the anomaly score for each training sample.
- **normalize** (*bool, default False*) – If True, return the normalized anomaly score.

Returns `anomaly_score` – Anomaly score for each sample.

Return type `array-like of shape (n_samples,)`

decision_function (*X=None, threshold=None*)

Compute the decision function of the given samples.

Parameters

- **X** (*array-like of shape (n_samples, n_features), default None*) – Data. If None, compute the decision function of the given training samples.
- **threshold** (*float, default None*) – User-provided threshold.

Returns `y_score` – Shifted opposite of the anomaly score for each sample. Negative scores represent outliers and positive scores represent inliers.

Return type `array-like of shape (n_samples,)`

fit (*X, y=None*)

Fit the model according to the given training data.

Parameters

- **X** (*array-like of shape (n_samples, n_features)*) – Training data.
- **y** (*ignored*) –

Returns `self` – Return self.

Return type `object`

fit_predict (*X, y=None*)

Fit the model according to the given training data and predict if a particular training sample is an outlier or not.

Parameters

- **X** (*array-like of shape (n_samples, n_features)*) – Training Data.
- **y** (*ignored*) –

Returns y_pred – Return -1 for outliers and +1 for inliers.

Return type array-like of shape (n_samples,)

plot_anomaly_score (*X=None, normalize=False, **kwargs*)

Plot the anomaly score for each sample.

Parameters

- **X** (*array-like of shape (n_samples, n_features), default None*) – Data. If None, plot the anomaly score for each training samples.
- **normalize** (*bool, default False*) – If True, return the normalized anomaly score.
- **ax** (*matplotlib Axes, default None*) – Target axes instance.
- **bins** (*int, str or array-like, default 'auto'*) – Number of hist bins.
- **figsize** (*tuple, default None*) – Tuple denoting figure size of the plot.
- **filename** (*str, default None*) – If provided, save the current figure.
- **hist** (*bool, default True*) – If True, plot a histogram of anomaly scores.
- **kde** (*bool, default True*) – If True, plot a gaussian kernel density estimate.
- **title** (*string, default None*) – Axes title. To disable, pass None.
- **xlabel** (*string, default 'Samples'*) – X axis title label. To disable, pass None.
- **xlim** (*tuple, default None*) – Tuple passed to *ax.xlim*.
- **ylabel** (*string, default 'Anomaly score'*) – Y axis title label. To disable, pass None.
- **ylim** (*tuple, default None*) – Tuple passed to *ax.ylim*.
- ****kwargs** (*dict*) – Other keywords passed to *ax.plot*.

Returns ax – Axes on which the plot was drawn.

Return type matplotlib Axes

plot_roc_curve (*X, y, **kwargs*)

Plot the Receiver Operating Characteristic (ROC) curve.

Parameters

- **X** (*array-like of shape (n_samples, n_features)*) – Data.
- **y** (*array-like of shape (n_samples,)*) – Labels.
- **ax** (*matplotlib Axes, default None*) – Target axes instance.
- **figsize** (*tuple, default None*) – Tuple denoting figure size of the plot.
- **filename** (*str, default None*) – If provided, save the current figure.
- **title** (*string, default 'ROC curve'*) – Axes title. To disable, pass None.
- **xlabel** (*string, default 'FPR'*) – X axis title label. To disable, pass None.

- **ylabel** (*string*, *default* 'TPR') – Y axis title label. To disable, pass None.
- ****kwargs** (*dict*) – Other keywords passed to *ax.plot*.

Returns *ax* – Axes on which the plot was drawn.

Return type matplotlib Axes

predict (*X=None*, *threshold=None*)

Predict if a particular sample is an outlier or not.

Parameters

- **X** (*array-like of shape (n_samples, n_features)*, *default* None) – Data. If None, predict if a particular training sample is an outlier or not.
- **threshold** (*float*, *default* None) – User-provided threshold.

Returns *y_pred* – Return -1 for outliers and +1 for inliers.

Return type array-like of shape (n_samples,)

kenchi.outlier_detection.clustering_based module

```
class kenchi.outlier_detection.clustering_based.MiniBatchKMeans (batch_size=100,  
                                                                contamina-  
                                                                tion=0.1,  
                                                                init='k-  
                                                                means++',  
                                                                init_size=None,  
                                                                max_iter=100,  
                                                                max_no_improvement=10,  
                                                                n_clusters=8,  
                                                                n_init=3, ran-  
                                                                dom_state=None,  
                                                                reassign-  
                                                                ment_ratio=0.01,  
                                                                tol=0.0)
```

Bases: *kenchi.outlier_detection.base.BaseOutlierDetector*

Outlier detector using K-means clustering.

Parameters

- **batch_size** (*int*, *optional*, *default* 100) – Size of the mini batches.
- **contamination** (*float*, *default* 0.1) – Proportion of outliers in the data set. Used to define the threshold.
- **init** (*str or array-like*, *default* 'k-means++') – Method for initialization. Valid options are ['k-means++', 'random'].
- **init_size** (*int*, *default*: 3 * *batch_size*) – Number of samples to randomly sample for speeding up the initialization.
- **max_iter** (*int*, *default* 100) – Maximum number of iterations.
- **max_no_improvement** (*int*, *default* 10) – Control early stopping based on the consecutive number of mini batches that does not yield an improvement on the smoothed inertia. To disable convergence detection based on inertia, set *max_no_improvement* to None.

- **n_clusters** (*int, default 8*) – Number of clusters.
- **n_init** (*int, default 3*) – Number of initializations to perform.
- **random_state** (*int or RandomState instance, default None*) – Seed of the pseudo random number generator.
- **reassignment_ratio** (*float, default 0.01*) – Control the fraction of the maximum number of counts for a center to be reassigned.
- **tol** (*float, default 0.0*) – Tolerance to declare convergence.

anomaly_score_

array-like of shape (n_samples,) – Anomaly score for each training data.

threshold_

float – Threshold.

cluster_centers_

array-like of shape (n_clusters, n_features) – Coordinates of cluster centers.

inertia_

float – Value of the inertia criterion associated with the chosen partition.

labels_

array-like of shape (n_samples,) – Label of each point.

cluster_centers_

inertia_

labels_

score (*X, y=None*)

Compute the opposite value of the given data on the K-means objective.

Parameters

- **X** (*array-like of shape (n_samples, n_features)*) – Data.
- **y** (*ignored*) –

Returns **score** – Opposite value of the given data on the K-means objective.

Return type *float*

kenchi.outlier_detection.density_based module

```
class kenchi.outlier_detection.density_based.LOF (algorithm='auto',      contamination=0.1,      leaf_size=30,      metric='minkowski',      novelty=False,      n_jobs=1,      n_neighbors=20,      p=2,      metric_params=None)
```

Bases: *kenchi.outlier_detection.base.BaseOutlierDetector*

Local Outlier Factor.

Parameters

- **algorithm** (*str, default 'auto'*) – Tree algorithm to use. Valid algorithms are ['kd_tree' 'ball_tree' 'auto'].
- **contamination** (*float, default 0.1*) – Proportion of outliers in the data set. Used to define the threshold.

- **leaf_size**(*int*, *default 30*) – Leaf size of the underlying tree.
- **metric**(*str or callable*, *default 'minkowski'*) – Distance metric to use.
- **novelty**(*bool*, *default False*) – If True, you can use predict, decision_function and anomaly_score on new unseen data and not on the training data.
- **n_jobs**(*int*, *default 1*) – Number of jobs to run in parallel. If -1, then the number of jobs is set to the number of CPU cores.
- **n_neighbors**(*int*, *default 20*) – Number of neighbors.
- **p**(*int*, *default 2*) – Power parameter for the Minkowski metric.
- **metric_params**(*dict*, *default None*) – Additional parameters passed to the requested metric.

anomaly_score_
array-like of shape (n_samples,) – Anomaly score for each training data.

threshold_
float – Threshold.

negative_outlier_factor_
array-like of shape (n_samples,) – Opposite LOF of the training samples.

n_neighbors_
int – Actual number of neighbors used for *kneighbors* queries.

x_
array-like of shape (n_samples, n_features) – Training data.

n_neighbors_

negative_outlier_factor_

kenchi.outlier_detection.distance_based module

```
class kenchi.outlier_detection.distance_based.KNN(aggregate=False, algorithm='auto', contamination=0.1, leaf_size=30, metric='minkowski', novelty=False, n_jobs=1, n_neighbors=20, p=2, metric_params=None)
```

Bases: *kenchi.outlier_detection.base.BaseOutlierDetector*

Outlier detector using k-nearest neighbors algorithm.

Parameters

- **aggregate**(*bool*, *default False*) – If True, return the sum of the distances from k nearest neighbors as the anomaly score.
- **algorithm**(*str*, *default 'auto'*) – Tree algorithm to use. Valid algorithms are ['kd_tree' 'ball_tree' 'auto'].

- **contamination** (*float, default 0.1*) – Proportion of outliers in the data set. Used to define the threshold.
- **leaf_size** (*int, default 30*) – Leaf size of the underlying tree.
- **metric** (*str or callable, default 'minkowski'*) – Distance metric to use.
- **novelty** (*bool, default False*) – If True, you can use `predict`, `decision_function` and `anomaly_score` on new unseen data and not on the training data.
- **n_jobs** (*int, default 1*) – Number of jobs to run in parallel. If -1, then the number of jobs is set to the number of CPU cores.
- **n_neighbors** (*int, default 20*) – Number of neighbors.
- **p** (*int, default 2*) – Power parameter for the Minkowski metric.
- **metric_params** (*dict, default None*) – Additional parameters passed to the requested metric.

anomaly_score_
array-like of shape (*n_samples*,) – Anomaly score for each training data.

threshold_
float – Threshold.

n_neighbors_
int – Actual number of neighbors used for *kneighbors* queries.

x_
array-like of shape (*n_samples, n_features*) – Training data.

References

x_

```
class kenchi.outlier_detection.distance_based.OneTimeSampling (contamination=0.1,
                                                                metric='euclidean',
                                                                novelty=False,
                                                                n_subsamples=20,
                                                                random_state=None,
                                                                metric_params=None)
```

Bases: `kenchi.outlier_detection.base.BaseOutlierDetector`

One-time sampling.

Parameters

- **contamination** (*float, default 0.1*) – Proportion of outliers in the data set. Used to define the threshold.
- **metric** (*str, default 'euclidean'*) – Distance metric to use.
- **novelty** (*bool, default False*) – If True, you can use `predict`, `decision_function` and `anomaly_score` on new unseen data and not on the training data.
- **n_subsamples** (*int, default 20*) – Number of random samples to be used.
- **random_state** (*int, RandomState instance, default None*) – Seed of the pseudo random number generator.

- **metric_params** (*dict*, *default None*) – Additional parameters passed to the requested metric.

anomaly_score_
array-like of shape (n_samples,) – Anomaly score for each training data.

threshold_
float – Threshold.

subsamples_
array-like of shape (n_subsamples,) – Indices of subsamples.

S_
array-like of shape (n_subsamples, n_features) – Subset of the given training data.

kenchi.outlier_detection.ensemble module

```
class kenchi.outlier_detection.ensemble.IForest (bootstrap=False, contamina-  
                                                tion=0.1, max_features=1.0,  
                                                max_samples='auto',  
                                                n_estimators=100, n_jobs=1, ran-  
                                                dom_state=None)
```

Bases: *kenchi.outlier_detection.base.BaseOutlierDetector*

Isolation forest (iForest).

Parameters

- **bootstrap** (*bool*, *False*) – If True, individual trees are fit on random subsets of the training data sampled with replacement. If False, sampling without replacement is performed.
- **contamination** (*float*, *default 0.1*) – Proportion of outliers in the data set. Used to define the threshold.
- **max_features** (*int or float*, *default 1.0*) – Number of features to draw from X to train each base estimator.
- **max_samples** (*int, float or str*, *default 'auto'*) – Number of samples to draw from X to train each base estimator.
- **n_estimators** (*int*, *default 100*) – Number of base estimators in the ensemble.
- **n_jobs** (*int*) – Number of jobs to run in parallel. If -1, then the number of jobs is set to the number of CPU cores.
- **random_state** (*int or RandomState instance*, *default None*) – Seed of the pseudo random number generator.

anomaly_score_
array-like of shape (n_samples,) – Anomaly score for each training data.

threshold_
float – Threshold.

estimators_
list – Collection of fitted sub-estimators.

estimators_samples_
int – Subset of drawn samples for each base estimator.

max_samples_
int – Actual number of samples.

kenchi.outlier_detection.reconstruction_based module

```
class kenchi.outlier_detection.reconstruction_based.PCA(contamination=0.1, it-
    erated_power='auto',
    n_components=None,
    random_state=None,
    svd_solver='auto',
    tol=0.0, whiten=False)
```

Bases: *kenchi.outlier_detection.base.BaseOutlierDetector*

Outlier detector using Principal Component Analysis (PCA).

Parameters

- **contamination** (*float*, default *0.1*) – Proportion of outliers in the data set. Used to define the threshold.
- **iterated_power** (*int*, default *'auto'*) – Number of iterations for the power method computed by `svd_solver == 'randomized'`.
- **n_components** (*int*, *float*, or *string*, default *None*) – Number of components to keep.
- **random_state** (*int* or *RandomState* instance, default *None*) – Seed of the pseudo random number generator.
- **svd_solver** (*string*, default *'auto'*) – SVD solver to use. Valid solvers are `['auto','full','arnold','randomized']`.
- **tol** (*float*, default *0.0*) – Tolerance to declare convergence for singular values computed by `svd_solver == 'arnold'`.
- **whiten** (*bool*, default *False*) – When True the *components_* vectors are multiplied by the square root of *n_samples* and then divided by the singular values to ensure uncorrelated outputs with unit component-wise variances.

anomaly_score_
array-like of shape (n_samples,) – Anomaly score for each training data.

threshold_
float – Threshold.

components_
array-like of shape (n_components, n_features) – Principal axes in feature space, representing the directions of maximum variance in the data.

explained_variance_
array-like of shape (n_components,) – Amount of variance explained by each of the selected components.

explained_variance_ratio_
array-like of shape (n_components,) – Percentage of variance explained by each of the selected components.

mean_
array-like of shape (n_features,) – Per-feature empirical mean, estimated from the training set.

noise_variance_
float – Estimated noise covariance following the Probabilistic PCA model from Tipping and Bishop 1999.

n_components_
int – Estimated number of components.

singular_values_
array-like of shape (n_components,) – Singular values corresponding to each of the selected components.

components_

explained_variance_

explained_variance_ratio_

mean_

n_components_

noise_variance_

score (*X*, *y=None*)
Compute the mean log-likelihood of the given data.

Parameters

- **X** (*array-like of shape (n_samples, n_features)*) – Data.
- **y** (*ignored*) –

Returns **score** – Mean log-likelihood of the given data.

Return type *float*

singular_values_

kenchi.outlier_detection.statistical module

```
class kenchi.outlier_detection.statistical.GMM(contamination=0.1, co-  
                                              variance_type='full',  
                                              init_params='kmeans', max_iter=100,  
                                              means_init=None, n_components=1,  
                                              n_init=1, precisions_init=None, ran-  
                                              dom_state=None, reg_covar=1e-  
                                              06, tol=0.001, warm_start=False,  
                                              weights_init=None)
```

Bases: *kenchi.outlier_detection.base.BaseOutlierDetector*

Outlier detector using Gaussian Mixture Models (GMMs).

Parameters

- **contamination** (*float, default 0.1*) – Proportion of outliers in the data set. Used to define the threshold.

- **covariance_type**(*str*, default 'full') – String describing the type of covariance parameters to use. Valid options are ['full' 'tied' 'diag' 'spherical'].
- **init_params**(*str*, default 'kmeans') – Method used to initialize the weights, the means and the precisions. Valid options are ['kmeans' 'random'].
- **max_iter**(*int*, default 100) – Maximum number of iterations.
- **means_init** (*array-like of shape (n_components, n_features)*, default None) – User-provided initial means.
- **n_init**(*int*, default 1) – Number of initializations to perform.
- **n_components**(*int*, default 1) – Number of mixture components.
- **precisions_init** (*array-like*, default None) – User-provided initial precisions.
- **random_state** (*int or RandomState instance*, default None) – Seed of the pseudo random number generator.
- **reg_covar** (*float*, default 1e-06) – Non-negative regularization added to the diagonal of covariance.
- **tol** (*float*, default 1e-03) – Tolerance to declare convergence.
- **warm_start** (*bool*, default False) – If True, the solution of the last fitting is used as initialization for the next call of *fit*.
- **weights_init** (*array-like of shape (n_components,)*, default None) – User-provided initial weights.

anomaly_score_
array-like of shape (n_samples,) – Anomaly score for each training data.

threshold_
float – Threshold.

converged_
bool – True when convergence was reached in *fit*, False otherwise.

covariances_
array-like – Covariance of each mixture component.

lower_bound_
float – Log-likelihood of the best fit of EM.

means_
array-like of shape (n_components, n_features) – Mean of each mixture component.

n_iter_
int – Number of step used by the best fit of EM to reach the convergence.

precisions_
array-like – Precision matrix for each component in the mixture.

precisions_cholesky_
array-like – Cholesky decomposition of the precision matrices of each mixture component.

weights_
array-like of shape (n_components,) – Weight of each mixture components.

converged_

covariances_

lower_bound_

means_

n_iter_

precisions_

precisions_cholesky_

score (*X*, *y=None*)

Compute the mean log-likelihood of the given data.

Parameters

- **X** (*array-like of shape (n_samples, n_features)*) – Data.
- **y** (*ignored.*) –

Returns **score** – Mean log-likelihood of the given data.

Return type float

weights_

class `kenchi.outlier_detection.statistical.HBOS` (*bins='auto', contamination=0.1, novelty=False*)

Bases: `kenchi.outlier_detection.base.BaseOutlierDetector`

Histogram-based outlier detector.

Parameters

- **bins** (*int, str or array-like, default 'auto'*) – Number of hist bins.
- **contamination** (*float, default 0.1*) – Proportion of outliers in the data set. Used to define the threshold.
- **novelty** (*bool, default False*) – If True, you can use `predict`, `decision_function` and `anomaly_score` on new unseen data and not on the training data.

anomaly_score_

array-like of shape (n_samples,) – Anomaly score for each training data.

threshold_

float – Threshold.

bin_edges_

array-like – Bin edges.

bin_widths_

array-like – Bin widths.

data_min_

array-like of shape (n_features,) – Per feature minimum seen in the data.

data_max_

array-like of shape (n_features,) – Per feature maximum seen in the data.

hist_

array-like of shape (n_features, bins) – Values of the histogram.

x_

array-like of shape (n_samples, n_features) – Training data.

References

```
class kenchi.outlier_detection.statistical.KDE(algorithm='auto', atol=0.0, bandwidth=1.0, breadth_first=True, contamination=0.1, kernel='gaussian', leaf_size=40, metric='euclidean', rtol=0.0, metric_params=None)
```

Bases: *kenchi.outlier_detection.base.BaseOutlierDetector*

Outlier detector using Kernel Density Estimation (KDE).

Parameters

- **algorithm** (*str*, default *'auto'*) – Tree algorithm to use. Valid algorithms are ['kd_tree' 'ball_tree' 'auto'].
- **atol** (*float*, default *0.0*) – Desired absolute tolerance of the result.
- **bandwidth** (*float*, default *1.0*) – Bandwidth of the kernel.
- **breadth_first** (*bool*, default *True*) – If true, use a breadth-first approach to the problem. Otherwise use a depth-first approach.
- **contamination** (*float*, default *0.1*) – Proportion of outliers in the data set. Used to define the threshold.
- **kernel** (*str*, default *'gaussian'*) – Kernel to use. Valid kernels are ['gaussian' 'tophat' 'epanechnikov' 'exponential' 'linear' 'cosine'].
- **leaf_size** (*int*, default *40*) – Leaf size of the underlying tree.
- **metric** (*str*, default *'euclidean'*) – Distance metric to use.
- **rtol** (*float*, default *0.0*) – Desired relative tolerance of the result.
- **metric_params** (*dict*, default *None*) – Additional parameters to be passed to the requested metric.

anomaly_score_

array-like of shape (n_samples,) – Anomaly score for each training data.

threshold_

float – Threshold.

x_

array-like of shape (n_samples, n_features) – Training data.

x_

score (*X*, *y=None*)

Compute the mean log-likelihood of the given data.

Parameters

- **x** (*array-like of shape (n_samples, n_features)*) – Data.
- **y** (*ignored*) –

Returns **score** – Mean log-likelihood of the given data.

Return type *float*

```
class kenchi.outlier_detection.statistical.SparseStructureLearning(alpha=0.01,  
                                                                    as-  
                                                                    sume_centered=False,  
                                                                    contam-  
                                                                    ina-  
                                                                    tion=0.1,  
                                                                    enet_tol=0.0001,  
                                                                    max_iter=100,  
                                                                    mode='cd',  
                                                                    tol=0.0001,  
                                                                    apclus-  
                                                                    ter_params=None)
```

Bases: `kenchi.outlier_detection.base.BaseOutlierDetector`

Outlier detector using sparse structure learning.

Parameters

- **alpha** (*float*, default 0.01) – Regularization parameter.
- **assume_centered** (*bool*, default False) – If True, data are not centered before computation.
- **contamination** (*float*, default 0.1) – Proportion of outliers in the data set. Used to define the threshold.
- **enet_tol** (*float*, default 1e-04) – Tolerance for the elastic net solver used to calculate the descent direction. This parameter controls the accuracy of the search direction for a given column update, not of the overall parameter estimate. Only used for mode='cd'.
- **max_iter** (*integer*, default 100) – Maximum number of iterations.
- **mode** (*str*, default 'cd') – Lasso solver to use: coordinate descent or LARS.
- **tol** (*float*, default 1e-04) – Tolerance to declare convergence.
- **apcluster_params** (*dict*, default None) – Additional parameters passed to `sklearn.cluster.affinity_propagation`.

anomaly_score_
array-like of shape (n_samples,) – Anomaly score for each training data.

threshold_
float – Threshold.

covariance_
array-like of shape (n_features, n_features) – Estimated covariance matrix.

graphical_model_
networkx Graph – GGM.

isolates_
array-like of shape (n_isolates,) – Indices of isolates.

labels_
array-like of shape (n_features,) – Label of each feature.

location_
array-like of shape (n_features,) – Estimated location.

n_iter_
int – Number of iterations run.

partial_corrcoef_
array-like of shape (n_features, n_features) – Partial correlation coefficient matrix.

precision_
array-like of shape (n_features, n_features) – Estimated pseudo inverse matrix.

References

covariance_

featurewise_anomaly_score(X)

Compute the feature-wise anomaly scores for each sample.

Parameters X (*array-like of shape (n_samples, n_features)*) – Data.

Returns anomaly_score – Feature-wise anomaly scores for each sample.

Return type *array-like of shape (n_samples, n_features)*

graphical_model_

isolates_

labels_

location_

n_iter_

partial_corrcoef_

plot_graphical_model(**kwargs)

Plot the Gaussian Graphical Model (GGM).

Parameters

- **ax** (*matplotlib Axes, default None*) – Target axes instance.
- **figsize** (*tuple, default None*) – Tuple denoting figure size of the plot.
- **filename** (*str, default None*) – If provided, save the current figure.
- **random_state** (*int, RandomState instance, default None*) – Seed of the pseudo random number generator.
- **title** (*string, default 'GGM (n_clusters, n_features, n_isolates)'*) – Axes title. To disable, pass None.
- ****kwargs** (*dict*) – Other keywords passed to *nx.draw_networkx*.

Returns ax – Axes on which the plot was drawn.

Return type *matplotlib Axes*

plot_partial_corrcoef(**kwargs)

Plot the partial correlation coefficient matrix.

Parameters

- **ax** (*matplotlib Axes, default None*) – Target axes instance.
- **cbar** (*bool, default True.*) – Whether to draw a colorbar.
- **figsize** (*tuple, default None*) – Tuple denoting figure size of the plot.
- **filename** (*str, default None*) – If provided, save the current figure.

- **title** (*string*, default *'Partial correlation'*) – Axes title. To disable, pass *None*.
- ****kwargs** (*dict*) – Other keywords passed to *ax.pcolormesh*.

Returns *ax* – Axes on which the plot was drawn.

Return type matplotlib Axes

precision_

score (*X*, *y=None*)

Compute the mean log-likelihood of the given data.

Parameters

- **X** (*array-like of shape (n_samples, n_features)*) – Data.
- **y** (*ignored*) –

Returns *score* – Mean log-likelihood of the given data.

Return type float

1.1.2.2 Module contents

1.2 Submodules

1.2.1 kenchi.pipeline module

`kenchi.pipeline.make_pipeline` (**steps*)

Construct a Pipeline from the given estimators. This is a shorthand for the Pipeline constructor; it does not require, and does not permit, naming the estimators. Instead, their names will be set to the lowercase of their types automatically.

Parameters **steps* (*list*) – List of estimators.

Returns *p*

Return type *Pipeline*

class `kenchi.pipeline.Pipeline` (*steps*, *memory=None*)

Bases: `sklearn.pipeline.Pipeline`

Pipeline of transforms with a final estimator.

Parameters

- **steps** (*list*) – List of (name, transform) tuples (implementing fit/transform) that are chained, in the order in which they are chained, with the last object an estimator.
- **memory** (*instance of joblib.Memory or string*, default *None*) – Used to cache the fitted transformers of the pipeline. By default, no caching is performed. If a string is given, it is the path to the caching directory. Enabling caching triggers a clone of the transformers before fitting. Therefore, the transformer instance given to the pipeline cannot be inspected directly. Use the attribute `named_steps` or `steps` to inspect estimators within the pipeline. Caching the transformers is advantageous when fitting is time consuming.

named_steps

dict – Read-only attribute to access any step parameter by user given name. Keys are step names and values are steps parameters.

anomaly_score (*X*, *normalize=False*)

Apply transforms, and compute the anomaly score for each sample with the final estimator.

Parameters

- **X** (*array-like of shape (n_samples, n_features)*) – Data.
- **normalize** (*bool, default False*) – If True, return the normalized anomaly score.

Returns **anomaly_score** – Anomaly score for each sample.

Return type array-like of shape (n_samples,)

featurewise_anomaly_score (*X*)

Apply transforms, and compute the feature-wise anomaly scores for each sample with the final estimator.

Parameters **X** (*array-like of shape (n_samples, n_features)*) – Data.

Returns **anomaly_score** – Feature-wise anomaly scores for each sample.

Return type array-like of shape (n_samples, n_features)

Raises `ValueError`

plot_anomaly_score (*X*, ***kwargs*)

Apply transforms, and plot the anomaly score for each sample with the final estimator.

Parameters

- **X** (*array-like of shape (n_samples, n_features)*) – Data.
- **ax** (*matplotlib Axes, default None*) – Target axes instance.
- **bins** (*int, str or array-like, default 'auto'*) – Number of hist bins.
- **figsize** (*tuple, default None*) – Tuple denoting figure size of the plot.
- **filename** (*str, default None*) – If provided, save the current figure.
- **hist** (*bool, default True*) – If True, plot a histogram of anomaly scores.
- **kde** (*bool, default True*) – If True, plot a gaussian kernel density estimate.
- **title** (*string, default None*) – Axes title. To disable, pass None.
- **xlabel** (*string, default 'Samples'*) – X axis title label. To disable, pass None.
- **xlim** (*tuple, default None*) – Tuple passed to *ax.xlim*.
- **ylabel** (*string, default 'Anomaly score'*) – Y axis title label. To disable, pass None.
- **ylim** (*tuple, default None*) – Tuple passed to *ax.ylim*.
- ****kwargs** (*dict*) – Other keywords passed to *ax.plot*.

Returns **ax** – Axes on which the plot was drawn.

Return type matplotlib Axes

plot_graphical_model

Apply transforms, and plot the Gaussian Graphical Model (GGM) with the final estimator.

Parameters

- **ax** (*matplotlib Axes, default None*) – Target axes instance.

- **figsize** (*tuple*, *default None*) – Tuple denoting figure size of the plot.
- **filename** (*str*, *default None*) – If provided, save the current figure.
- **random_state** (*int*, *RandomState instance*, *default None*) – Seed of the pseudo random number generator.
- **title** (*string*, *default 'GGM (n_clusters, n_features, n_isolates)'*) – Axes title. To disable, pass *None*.
- ****kwargs** (*dict*) – Other keywords passed to *nx.draw_networkx*.

Returns *ax* – Axes on which the plot was drawn.

Return type matplotlib Axes

plot_partial_corrcoef

Apply transforms, and plot the partial correlation coefficient matrix with the final estimator.

Parameters

- **ax** (*matplotlib Axes*, *default None*) – Target axes instance.
- **cbar** (*bool*, *default True*.) – Whether to draw a colorbar.
- **figsize** (*tuple*, *default None*) – Tuple denoting figure size of the plot.
- **filename** (*str*, *default None*) – If provided, save the current figure.
- **title** (*string*, *default 'Partial correlation'*) – Axes title. To disable, pass *None*.
- ****kwargs** (*dict*) – Other keywords passed to *ax.pcolormesh*.

Returns *ax* – Axes on which the plot was drawn.

Return type matplotlib Axes

plot_roc_curve (*X*, *y*, ***kwargs*)

Apply transforms, and plot the Receiver Operating Characteristic (ROC) curve with the final estimator.

Parameters

- **X** (*array-like of shape (n_samples, n_features)*) – Data.
- **y** (*array-like of shape (n_samples,)*) – Labels.
- **ax** (*matplotlib Axes*, *default None*) – Target axes instance.
- **figsize** (*tuple*, *default None*) – Tuple denoting figure size of the plot.
- **filename** (*str*, *default None*) – If provided, save the current figure.
- **title** (*string*, *default 'ROC curve'*) – Axes title. To disable, pass *None*.
- **xlabel** (*string*, *default 'FPR'*) – X axis title label. To disable, pass *None*.
- **ylabel** (*string*, *default 'TPR'*) – Y axis title label. To disable, pass *None*.
- ****kwargs** (*dict*) – Other keywords passed to *ax.plot*.

Returns *ax* – Axes on which the plot was drawn.

Return type matplotlib Axes

1.2.2 kenchi.visualization module

```
kenchi.visualization.plot_anomaly_score(anomaly_score, ax=None, bins='auto', fig-
                                         size=None, filename=None, hist=True, kde=True,
                                         threshold=None, title=None, xlabel='Samples',
                                         xlim=None, ylabel='Anomaly score', ylim=None,
                                         **kwargs)
```

Plot the anomaly score for each sample.

Parameters

- **anomaly_score** (array-like of shape *(n_samples,)*) – Anomaly score for each sample.
- **ax** (matplotlib Axes, default None) – Target axes instance.
- **bins** (int, str or array-like, default 'auto') – Number of hist bins.
- **figsize** (tuple, default None) – Tuple denoting figure size of the plot.
- **filename** (str, default None) – If provided, save the current figure.
- **hist** (bool, default True) – If True, plot a histogram of anomaly scores.
- **kde** (bool, default True) – If True, plot a gaussian kernel density estimate.
- **threshold** (float, default None) – Threshold.
- **title** (string, default None) – Axes title. To disable, pass None.
- **xlabel** (string, default 'Samples') – X axis title label. To disable, pass None.
- **xlim** (tuple, default None) – Tuple passed to *ax.xlim*.
- **ylabel** (string, default 'Anomaly score') – Y axis title label. To disable, pass None.
- **ylim** (tuple, default None) – Tuple passed to *ax.ylim*.
- ****kwargs** (dict) – Other keywords passed to *ax.plot*.

Returns **ax** – Axes on which the plot was drawn.

Return type matplotlib Axes

Examples

```
kenchi.visualization.plot_roc_curve(y_true, y_score, ax=None, figsize=None, filename=None, title='ROC curve', xlabel='FPR', ylabel='TPR', **kwargs)
```

Plot the Receiver Operating Characteristic (ROC) curve.

Parameters

- **y_true** (array-like of shape $(n_samples,)$) – True Labels.
- **y_score** (array-like of shape $(n_samples,)$) – Target scores.
- **ax** (matplotlib Axes, default None) – Target axes instance.
- **figsize** (tuple, default None) – Tuple denoting figure size of the plot.
- **filename** (str, default None) – If provided, save the current figure.
- **title** (string, default 'ROC curve') – Axes title. To disable, pass None.
- **xlabel** (string, default 'FPR') – X axis title label. To disable, pass None.
- **ylabel** (string, default 'TPR') – Y axis title label. To disable, pass None.
- ****kwargs** (dict) – Other keywords passed to *ax.plot*.

Returns **ax** – Axes on which the plot was drawn.

Return type matplotlib Axes

Examples

`kenchi.visualization.plot_graphical_model(G, ax=None, figsize=None, filename=None, random_state=None, title='GGM', **kwargs)`

Plot the Gaussian Graphical Model (GGM).

Parameters

- **G** (*networkx Graph*) – GGM.
- **ax** (*matplotlib Axes, default None*) – Target axes instance.
- **figsize** (*tuple, default None*) – Tuple denoting figure size of the plot.
- **filename** (*str, default None*) – If provided, save the current figure.
- **random_state** (*int, RandomState instance, default None*) – Seed of the pseudo random number generator.
- **title** (*string, default 'GGM'*) – Axes title. To disable, pass None.
- ****kwargs** (*dict*) – Other keywords passed to `nx.draw_networkx`.

Returns **ax** – Axes on which the plot was drawn.

Return type `matplotlib Axes`

Examples

```
kenchi.visualization.plot_partial_corrcoef(partial_corrcoef, ax=None, cbar=True, fig-  
size=None, filename=None, title='Partial correlation', **kwargs)
```

Plot the partial correlation coefficient matrix.

Parameters

- **partial_corrcoef** (*array-like of shape (n_features, n_features)*) – Partial correlation coefficient matrix.
- **ax** (*matplotlib Axes, default None*) – Target axes instance.
- **cbar** (*bool, default True.*) – Whether to draw a colorbar.
- **figsize** (*tuple, default None*) – Tuple denoting figure size of the plot.
- **filename** (*str, default None*) – If provided, save the current figure.
- **title** (*string, default 'Partial correlation'*) – Axes title. To disable, pass None.
- ****kwargs** (*dict*) – Other keywords passed to *ax.pcolormesh*.

Returns *ax* – Axes on which the plot was drawn.

Return type matplotlib Axes
